STANDARD OPERATING PROCEDURE · TRAINING GUIDE

3Boxes HRMS Mobile App

Everyday operations for HR, Admin and Employees — on the go

This guide is the single source of truth for using the 3Boxes HRMS mobile application. It walks every user through installation and the brand-new sign-in experience (starry welcome, mobile-number or employee-ID sign-in with one-time-code verification and fingerprint unlock), daily attendance punching, leave applications, payslips, the HR Help Desk that is connected to the web support ticketing system, project chat, and explains exactly what employees may change themselves, what goes to HR/Admin for approval, and what stays locked. HR/Admin users get dedicated chapters on employee management, approvals, ticket operations, reports and team attendance.

HR / ADMIN · EMPLOYEES · CEO · MANAGERS

App version v1.7.0 (build 34) · **Released** October 2026

Platform Android APK · **Distribution** Web login page download only

CHAPTER 1

About This Guide & Installing the App

This Standard Operating Procedure (SOP) and training guide describes how to use the 3Boxes HRMS mobile application in day-to-day work. It is written for two audiences at once: **employees**, who use the app to punch attendance, apply for leave, check payslips, work on project tasks, respond in chat and keep their own profile up to date; and **HR / Admin users** (including the CEO and managers with admin rights), who additionally manage employee records, approve requests, review reports and monitor team attendance from the same app. Everything in this guide reflects app version **v1.7.0 (build 34)** — if your app shows an older version on the login or profile screen, please update first using the steps below. Version 1.7.0 ships the redesigned login experience, the HR Help Desk, the announcements banner, **dual-channel OTP delivery (SMS + email)**, a **Contact HR ticket form** right on the login screen, and a **compact one-screen Home dashboard** with a colourful Quick Access grid.

> **Download policy:** the 3Boxes HRMS mobile app is distributed as an Android APK file, downloadable **only from the web login page** of your company workspace. There is no Play Store listing and no PWA/website shortcut — installing from anywhere else is not supported.

Install the app (one time)

1. **Open your company workspace in the phone browser** — for example **marqaitechgroup.3boxeshrms.com** — or simply open **3boxeshrms.com**. Do this before logging in; the download section sits on the login page itself.
2. **Tap the Android app download button** in the login page's download section. The current release APK (v1.7.0) downloads to your device.
3. **Allow the install.** Android asks for permission to install from your browser ("Install unknown apps"). Grant it once, then confirm the installation prompt.
4. **Upgrades are in-place.** The app is signed with a permanent release key, so every new version installs directly over the old one — no uninstall needed. When HR announces an update, repeat steps 1–3 to fetch the latest APK.

First launch

On first launch the app shows the splash screen and asks you to accept the terms of use. Accept them once and you move straight to the sign-in screen described in Chapter 2. If your company uses a dedicated workspace link, prefer opening that tenant link in the browser for the download — it guarantees you get the build configured for your organisation.

CHAPTER 2

Getting Started — Login & Workspace

Version 1.7.0 keeps the redesigned sign-in experience and polishes every rough edge reported by the field: the **Employee ID tab always opens the full alphanumeric keyboard** (letters and numbers, no more stuck numeric pad), **Remember me** now works on **both** tabs and pre-fills your details on the next launch, the one-time code reaches you by **SMS and email**, and **Contact HR raises a real help-desk ticket** that instantly alerts HR / Admin / IT Admin by app notification and email — all before you have managed to sign in. The app connects to the same accounts as the web application, and the workspace detection ladder (demo workspace → central hub → your company's dedicated workspace) still runs automatically and transparently underneath.

The sign-in flow, step by step

1. **Welcome screen.** The app opens on a deep-navy starry sky with the 3Boxes HRMS logo card and the tagline "Your workplace, in one place". Tap the **arrow button** to continue to sign-in.

2. **Choose a sign-in method.** The sign-in screen has a violet gradient header with the logo and two tabs: **Mobile Number** and **Employee ID**. Pick whichever is easier for you — both lead to the same account.

3. **Mobile Number tab:** select your country code (+91 by default), enter your registered mobile number, optionally leave **Remember me** on so the number is pre-filled next time, and tap **Continue →**. The app sends a 6-digit one-time code **by SMS to your phone and by email** to the registered address, then opens the verification screen.

4. **Employee ID tab:** tap the tab and the full alphanumeric keyboard opens immediately — type your Employee ID or work email plus your password, keep **Remember me** on to auto-save your identity on this device, and tap **Sign In**. **Forgot password?** sits right next to it — tap it and contact your HR team for a reset, exactly as on web.

5. **Verify your number (OTP).** The verification screen shows the masked destinations, six code boxes, a **resend countdown** and a **Change number** link. A status chip under the headline tells you exactly **which channel carried the code — SMS, email or both**. Enter the code and tap **Verify & continue**.

6. **Enable fingerprint / Face ID.** After the first successful sign-in the app offers biometric unlock (the same Face ID / Fingerprint row is visible on both sign-in tabs). Enable it on personal phones — the next launch opens with a fingerprint prompt instead of the keyboard.

OTP tips — dual-channel delivery

The code now goes out on **two channels at once**: SMS to your registered mobile number and email to your registered inbox (check spam). The chip on the verification screen reports what actually went out, so you never wait on a message that was never sent. The code is single-use and expires quickly; requesting a new one invalidates the old. If no channel could deliver — for example before your SMS gateway is configured — the screen says so immediately and offers a one-tap **Raise a ticket to HR** shortcut; on the demo workspace it also shows the code inline so the flow stays testable.

Contact HR — raises a real ticket

Both sign-in tabs end with a **Contact HR** link, and it is no longer just an information sheet: tapping it opens a short form (issue type — OTP not received, sign-in problem, account locked, password reset, unknown Employee ID — plus optional Employee ID, name and reply-to contact). Submitting creates a **real help-desk ticket** in your workspace's Support & AI → Help Desk queue, and every **HR / Admin / IT Admin** receives an **in-app alert and an email** (plus an SMS nudge when a gateway is configured) within seconds. You get the ticket number on screen — no colleague login needed.

Security basics: never share your login or the one-time codes; biometric unlock is tied to the device's own fingerprint/face store, so a colleague's finger will simply not open your app. On shared devices skip biometric setup and sign out after use.

CHAPTER 3

Home Dashboard at a Glance

The Home screen is your operations hub, and version 1.7.0 makes it **compact and colourful**: everything now fits on **one screen without scrolling**. A rotating **announcements banner** sits under the header, the fingerprint **punch tabs** stay front and centre, a single **KPI strip** (worked today · this month · on leave) replaces three separate cards, and a bright 4-column **Quick Access grid** reaches every module in one tap. **Birthdays** appear as a slim card only when there is someone to celebrate. The full module list still lives in the ☰ menu; the bottom navigation is **Home · Chat · Attendance · Profile** with a floating chat bubble above it for instant project and team conversations.

Punch tabs (top of Home)

- **Check / Break Time / Leave tabs** — fingerprint-style punch buttons; the label flips to Check Out while you are checked in.
- **KPI strip** — worked time today (live), this month's attended days with attendance %, and how many colleagues are on leave — one tappable row.
- **Tap through** — the KPI columns open Attendance, the attendance report and the Directory respectively.

Announcements banner

A slim banner under the header auto-rotates through **pinned posts and HR announcements** from the company feed (latest post as fallback). Tap it to open the full Announcements list. What HR posts on the web Social Feed reaches every phone within seconds — no more "did anyone see the memo?".

One screen, no scrolling

The old home stacked a time log, a weekly chart, an organisation card, a month card, a quick-links rail and a module grid — beautiful, but it scrolled forever. Version 1.7.0 folds all of that into **one compact view**: banner → punch tabs → KPI strip → Quick Access grid → slim birthdays. The weekly hours breakdown lives on in the Attendance module's report screens, one tap away.

Birthdays & Send Wishes

The birthdays card lists colleagues whose **original birthday** falls today plus the **upcoming 45 days** (hidden entirely when the list is empty). Tap **Send Wishes** to deliver a greeting instantly — the colleague receives it in-app and by email, and the company posts an automatic greeting too.

Quick Access grid

A bright 4-column tile grid merges the old Quick Links rail and the Modules grid: **Attendance, Leaves, Payroll, Employees, Projects, Payslips, Requests, Directory, Help Desk, Feeds** — plus **Reports** and **Team Attendance** for HR/Admin roles. Every tile is colour-coded and one tap deep; less-used destinations (profile, notifications, connection check) live in the ☰ drawer so the dashboard stays lean.

Team snapshot & navigation

The KPI strip's third column shows **how many colleagues are on leave today** out of the company total — the same live numbers the admin dashboard sees. The bottom navigation carries **Home · Chat · Attendance · Profile**, and the floating **chat bubble** opens project and team conversations from anywhere on the dashboard.

Quick Access grid — who sees what

Module tile	Employee	HR / Admin & CEO
Employee Management — directory, add/view employees	HIDDEN	VISIBLE
Leave Management — apply, balance, approve	VISIBLE	VISIBLE + approvals
Attendance — punch, breaks, regularisation	VISIBLE	VISIBLE
Payroll — payslips with filters	VISIBLE	VISIBLE
Projects — projects and tasks	VISIBLE	VISIBLE
Chat — bottom-nav tab, project & team conversations	VISIBLE	VISIBLE
HR Help Desk — support tickets, web-connected	VISIBLE	VISIBLE + ops view
Reports — leave / attendance / employees / projects	HIDDEN	VISIBLE
Team Attendance — team view + daily status	HIDDEN	VISIBLE
Notifications & **My Profile**	VISIBLE	VISIBLE

CHAPTER 4

HR Help Desk — Support Ticketing on the Go

The **HR Help Desk** (Quick Links tile, headset icon) is the mobile window into the **same support ticketing system the web app uses under Support & AI → Help Desk**. A ticket raised on the phone appears instantly in the web queue for HR/Admin, replies flow both ways, and status changes sync in real time — one ticketing system, two front-ends, zero duplication.

Working a ticket from the phone

1. **Raise a ticket.** Open the Help Desk tile and tap the create button. Pick a category, write a clear subject and description, and submit — HR/Admin are notified immediately. **Cannot sign in at all?** The login screen's Contact HR form raises the same ticket without any session, asking for your Employee ID and issue — HR / Admin / IT Admin get the alert by app notification and email.
2. **Track "My tickets".** Employees see their own tickets with live status (open / in progress / resolved / closed) — the server enforces the self-scope, so nobody can read a colleague's tickets.
3. **Reply in the thread.** Open a ticket to read the full conversation and add comments; every reply is visible to HR/Admin on web the moment it lands.
4. **HR/Admin operations view.** HR/Admin additionally see **all tenant tickets**, answer threads from the phone and **change ticket status** as they work through the queue — useful between meetings without opening a laptop.

> **Good ticket hygiene:** one issue per ticket, a descriptive subject ("Payslip September — HRA component wrong" beats "help"), and attach context up front. Clear tickets get resolved faster and the history stays searchable for both sides.

CHAPTER 5

Attendance SOP — Punch, Break, Regularise

Attendance on mobile uses the same punch pipeline as the biometric and web channels: every Check In / Check Out runs through the shared PunchFlow, which captures your GPS position and validates it before recording the punch. This protects the accuracy of attendance data — punches taken from impossible locations or with spoofed GPS are rejected. Punches recorded on mobile flow straight into the same attendance records your HR team reviews on the web, so there is nothing extra to submit or reconcile.

Daily punching procedure

1. **Enable location services** before punching — the app needs GPS to stamp the punch with a valid position. Keep the device's time automatic.
2. **Check In** when your shift starts — from the Home quick card or the Attendance module. The card shows today's status, working hours so far and your latest punch time.
3. **Start Break** when you step away and **End Break** when you return. Break windows are recorded against the day and reflected in your worked-hours total.
4. **Check Out** at the end of the shift. The punch card flips back and your day is complete — in time, out time, breaks and total hours.

Forgot to punch?

Do not panic and do not double-punch. Raise a **regularisation request** from the Attendance module (or the Raise shortcut) stating the correct in/out times. Your manager and HR receive it and, once approved, the day's attendance is corrected at the source — payroll then reads the corrected data.

If GPS fails

If the punch returns a location error: confirm Location is ON for the app in Android settings, move near a window or open space, and retry. The app blocks mock-location providers — removing any fake-GPS app resolves persistent rejections.

For HR / Admin — Team Attendance

The **Team Attendance** tile (admin, CEO and HR only) shows who is present, on leave or missing punches for the day, with a daily status entry view. Combined with the **Reports** module (attendance and leave reports), it replaces the old "ask around" morning routine — open it first thing and you have the whole organisation's attendance posture on one screen.

CHAPTER 6

Leave SOP — Apply, Track, Approve

Leave requests raised on mobile go through exactly the same workflow as on web: the request is created against your leave policy, your approver chain is resolved automatically, and every decision triggers a notification (and email) to the people involved. Balances shown in the app are the live balances HR maintains, so what you see is what payroll will honour.

Apply for leave

1. **Open Leave Management** (or tap **Request Leave** on Home) and tap **Apply Leave**.
2. **Choose the leave type** — casual, sick, earned and any company-specific types configured by HR.
3. **Pick the dates** and enter a short reason. Apply **before** the leave date wherever possible — planned leave applied in advance is approved faster and protects payroll.
4. **Submit.** The request appears in your list with a status chip: **Pending**, **Approved** or **Rejected**. You are notified the moment a decision is made.

Track balances

The Leave home shows your remaining balance per leave type alongside this year's usage. Check it before applying — the form warns when a request exceeds the balance, but the balance view is the reliable place to plan long breaks.

For approvers — act on the go

HR/Admin, CEO and managers with approval rights see **Approve** and **Reject** actions directly on each pending card, and can **apply leave on behalf of an employee** from the same screen (useful for field staff who cannot raise it themselves). Every action is audit-logged.

CHAPTER 7

Payroll SOP — Payslips on the Go

The Payroll module brings your payslip history to the phone. Payslips appear here once payroll for the month is processed and released by the payroll manager — the mobile list mirrors the web payroll records exactly, including the official company payslip format used by the organisation. Employees do not need to request payslips from HR any more; the current and historical months are self-service.

View a payslip

1. **Open Payroll** from the Modules grid. The Payslips list shows each processed month with its net salary.
2. **Filter if needed** — by month, by employee (for HR/Admin and payroll managers reviewing a specific person) or by status, using the filter bar.
3. **Tap a payslip** to open the detail sheet: earnings, deductions and the net pay breakdown for that month. Verify the figures and raise a ticket if something looks wrong — do not wait for payday.

Note for HR / payroll managers: mobile payroll respects the web's release rules — payslip details follow the company payroll policy, and actions such as downloading released payslips are governed by the payroll-manager permission set configured on web. If a payslip you expect is missing, check that the payroll run for that month has been released.

CHAPTER 8

Projects, Tasks & Collaboration

Project work no longer requires a laptop. The Projects module mirrors the web project workspace: you see the projects you are allocated to, the tasks assigned to you and their live status. When a task is created for you or a task moves to a new workflow step, you receive a

push notification on the phone and an email — the same dual-channel alert that web users get — so nothing sits unnoticed until the next stand-up.

- **Projects** — open the tile to see your allocated projects; tap one for its detail view with tasks, members and progress.
- **Tasks** — check what is assigned to you, review descriptions, dates and attachments posted from web or mobile, and move your work forward by updating the task as you go.
- **Chat** — Chat lives in the **bottom navigation** (and behind the floating bubble on Home and the web dashboard), now wearing a **SmartHR-style redesign**: a royal-blue gradient header, counter chips for **All · Direct · Channels · Unread**, a **Quick chat** strip of recent one-to-one partners with online dots, and red unread badges. Open company and **project-specific conversations**, see member lists, and coordinate there instead of personal messaging apps, so decisions stay inside the organisation's record. The same conversations are reachable from the **chat icon on the web dashboard** — start a thread on the phone, continue it on the laptop.
- **Notifications** — the bell tile (and the counter on Home) collects every alert: task assignments and step changes, leave decisions, photo approval results, payslip releases and HR announcements.

> **Working rhythm that works**
>
> A practical cadence for most teams: check the bell first thing in the morning, punch in, work from the Projects list during the day, and punch out at shift end. Because task updates notify both the assignee and the manager instantly, the app effectively replaces the "any update?" follow-up message — status flows to whoever needs it automatically.

CHAPTER 9

My Profile — Self-Service Rules

My Profile mirrors the full employee record from the web employee module. It is where you keep your working information current — and it is also where the company's data-governance rules are enforced on the phone. Every field falls into one of three tiers, and the app labels the difference clearly so you always know what happens when you save.

YOU CAN EDIT DIRECTLY

Phone number, personal email, current and permanent address, emergency contacts, blood group and similar contact-level details save **immediately**. As a safeguard, HR/Admin automatically receive an in-app notification **and an email** showing the field, the old value and the new value — so every self-service change is transparent to HR without needing approval.

GOES TO HR/ADMIN FOR APPROVAL

Your **profile photo** is gated. When you upload a new photo it enters a pending state — you see a "submitted" badge, but other colleagues keep seeing the current photo. HR/Admin review it in the Photo Approvals queue and either publish it or reject it with a reason; you are notified of the decision either way.

LOCKED — CONTACT HR/ADMIN

Date of birth, first name and last name are identity fields and cannot be edited from self-service on mobile or web — the fields appear disabled. If one of them is wrong (for example a typo from onboarding), raise it with HR/Admin, who will correct the record from the employee module. The same protection applies to every update request you raise from the app.

Sections you will find in My Profile

- **Personal** — contact details, addresses, blood group, and your **interests** chips.
- **Original Birthday** — the date used for birthday celebrations; HR/Employee can set it any time, and it may differ from the official date of birth used in records.
- **Employment** — department, designation, reporting manager (read-only), plus your **technical skills** with proficiency level and years of experience.
- **Experience** — every previous company with role, duration, the **domains you worked in** (multiple selection), company logo, category and level, and related **letters** (offer, relieving, experience, appraisal, payslip) you can attach and open.
- **Achievements** — awards and recognitions from your current or previous companies with category, issuer and date.
- **Insurance** — your medical insurance details and the **family details** used for medical cover.
- **Documents & Policies** — company documents assigned to you and the policy grid, each with View and Download.

CHAPTER 10

For HR / Admin — Management Operations

HR/Admin users (and the CEO) carry the organisation's operational load on the same app. The management tiles — Employee Management, Reports and Team Attendance — appear in the Modules grid only for these roles, and their content matches the web modules one-for-one so a task started on web can be finished on mobile and vice versa.

Employee Management

- **Directory & list** — search the workforce, view each employee's profile including their total experience computed from their career entries.

- **Add employee** — the guided multi-step form (personal, address, employment, bank, emergency) with the same mandatory-field rules as web; required fields are marked so records are complete at creation time.
- **Documents** — view an employee's documents with download; identity documents such as Aadhaar can be verified by scanning the QR code from the verification tab.
- **Photo approvals** — review employee photo submissions in the queue: approve to publish the new photo, or reject with a mandatory reason; the employee is notified automatically.
- **Help Desk operations** — open the Help Desk tile to see **all tenant tickets**, reply in any thread and **change ticket status** from the phone; the same queue your employees see under "My tickets" on mobile and on the web Support & AI module.

Reports & Team Attendance

The **Reports** tile opens leave, attendance, employee and project reports filtered for your permission set — the same reports the web admin dashboard produces, formatted for the phone. **Team Attendance** gives the day view of who is in, out or on leave with a daily status entry capability for supervisors. A recommended routine: review Team Attendance every morning, clear pending leave approvals before lunch, and skim the Reports module weekly to catch trends — rising regularisations or unused leave — before they become payroll corrections.

> **Birthday wishes monitoring:** the Home birthdays card lists this month's celebrants for the whole month. HR/Admin should keep **original birthdays** filled in for every employee — celebrations (and the automatic greeting) only fire for employees whose original birthday is recorded. If it is missing, fill it from the employee module on web or mobile.

CHAPTER 11

Roles & Permissions Matrix

The table below summarises what each role can do from the mobile app. It reflects the same permission model as the web application — the app never grants a right the web would deny, and every sensitive action is validated server-side, not just hidden in the UI.

Capability	Employee	HR / Admin	CEO
Check in / out, breaks, regularisation	YES	YES	YES
Apply for leave (self)	YES	YES	YES
Approve / reject leave, apply on behalf	NO	YES	YES
View own payslips	YES	YES	YES
Employee directory with experience	NO	YES	YES
Add / view employees, documents	NO	YES	VIEW

Capability	Employee	HR / Admin	CEO
Reports (leave / attendance / employees / projects)	NO	YES	YES
Team attendance + daily status	NO	YES	YES
Approve / reject profile photos	NO	YES	NO
Edit own contact details (HR notified)	YES	YES	YES
Edit DOB / first / last name	LOCKED	YES	VIA HR
Send birthday wishes	YES	YES	YES
Raise & reply to Help Desk tickets (self-scope)	YES	YES	YES
View all tickets & change ticket status	NO	YES	VIEW
Chat on projects & teams (mobile + web)	YES	YES	YES

CHAPTER 12

Golden Rules, Troubleshooting & Support

A handful of habits keep mobile HRMS usage smooth for everyone. They take seconds to follow and prevent most of the support tickets HR receives — read them once, apply them daily.

Golden rules

- Punch in and out **every working day**, with location enabled.
- Apply for leave **in advance**; use regularisation only for genuine misses.
- Keep your profile **current** — phone, address, emergency contacts, skills, experience letters.
- Never **share your login** or install the APK from unofficial sources.
- Check the **notification bell** daily; act on approvals the same day.
- Raise a **Help Desk ticket** instead of side-channel messages — tickets are tracked, searchable and answered faster.

Escalation path

Step 1 — Employee: try the troubleshooting table first.
Step 2 — HR/Admin: raise the issue with your HR team (in person or via the helpdesk); they can resolve account, data and approval issues.
Step 3 — Super admin: platform-level or technical issues are escalated by HR/Admin to the 3Boxes HRMS super admin with details of the app version and the affected account.

Troubleshooting

Problem	What to do
APK will not install — "blocked" message	Allow "Install unknown apps" for your browser in Android settings, then reopen the downloaded file. If upgrading, simply install over the existing app — no uninstall needed.
Cannot sign in	Confirm the email and password work on the web login of your workspace. If web works but mobile does not, update to the latest APK; if both fail, ask HR/Admin to reset the password or use **Contact HR** on the login screen to raise a ticket straight to the team. On the Mobile Number tab, make sure the number is the one registered in HRMS.
Numeric keyboard stuck on Employee ID tab	Fixed in v1.7.0 — the Employee ID field now always opens the full alphanumeric keypad. If you still see numbers only, update the APK from the web login page.
Remember me not saving details	Fixed in v1.7.0 — the switch now saves your identity on **both** tabs (number + country code, or Employee ID/email) and pre-fills them on the next launch. Turning it off clears the stored identity.
OTP code not received	Codes now travel by **SMS and email in parallel** — check both the phone inbox and email spam. The status chip on the verification screen shows which channels actually carried the code. If nothing arrived, tap **Still no code? Raise a ticket to HR** — HR / Admin / IT Admin are alerted instantly and can verify your identity, or switch to the Employee ID tab in the meantime.
Ticket stuck or misrouted	Open the ticket thread and add details in a reply — HR/Admin see it instantly on web and mobile. Only HR/Admin can change ticket status; if the category was wrong, say so in the thread rather than raising a duplicate.
Punch rejected — GPS error	Enable location permission for the app, disable any mock/fake-GPS app, retry outdoors or near a window.
Data looks stale (leave balance, payslip)	Pull-to-refresh the screen; if still stale, verify on web and ask HR/Admin to confirm the record was saved and released.
Notification not received	Open the bell tile — the alert is stored there even if the push was missed. Check Android notification permission for the app.
Profile change rejected or locked	Identity fields (DOB, names) are locked by policy — contact HR/Admin. Photo rejections come with a reason; resubmit a compliant photo.

You are ready to go.

- ✓ Install v1.7.0 from your workspace's web login page and sign in with mobile number or employee ID.
- ✓ Punch in with GPS, apply leave ahead of time, check payslips yourself.
- ✓ Complete My Profile — skills, experience, achievements, family details.
- ✓ HR/Admin: clear approvals and Help Desk tickets daily, watch Team Attendance each morning.
